

Project Title: Khwaja Yunus Ali University Alumni Management System.

Introduction:

This is our project-on-project development course that are conducting in this summer 2022 semester. In this project development course, we have chosen to work on web development. And our project was on “KYAU Alumni Management System”. In our alumni management system, there are different types users. Based on the users there are different types of options available in our website. Such as, an admin can control the total system i.e: admin can approve new members, can delete a post etc. In the use case diagram, I have explained in details about the project we have completed.

Use Case Diagram:

Your Part:

1. Front End:

2. Back End

Limitations:

In this project or in our website we don't have any searching option. That's why we can't able to search a particular user or any other post. And another limitation of our website is that, there is no chat option. That's why users can not communicate with each other if they want. There is only one authentication system to login into our website. Because, we have not implemented multiple ways to authenticate a user to login.

Conclusion:

In this project we have learned the uses of HTML, CSS, Javascript and PHP. We have also learned about how these technologies works together. Also, we have learned the implementation of database and to connect with our website / database connection.

In future we will try to overcome the limitations mentioned above by implemented the features which is not present in our project/website.
